           prof.dr. M.G.A.A.M. Nijpels
copromotor: dr. M.J. Alssema
CONTENTS

1 Introduction 7
2 The rise in intermediate hyperglycaemia between 1989 and 2006 in the Caucasian population of the Netherlands. Results from the Hoorn Study and the New Hoorn Study 21
3 Estimating the individual risk of diabetes: not based solely on overweight 43
4 The role of adiposity and lifestyle in the relationship between family history of diabetes and 20-year incidence of type 2 diabetes in U.S. women 55
5 Combined effects of single-nucleotide polymorphisms in GCK, GCKR, G6PC2 and MTNR1B on fasting plasma glucose and type 2 diabetes risk 79
6 The relationship between HbA1c and glucose levels in the general Dutch population: the New Hoorn Study 95
7 Changes in glucose and A1c prior to the diagnosis of diabetes. A 10 year follow-up of the Hoorn Study 113
8 HbA1c is an independent predictor of non-fatal cardiovascular disease in a Caucasian population without diabetes. A 10-year follow-up of the Hoorn Study 133
9 General Discussion 157
