# Table of contents

**Chapter 1** ................................................................................................................... 6  
General introduction: what precedes rheumatoid arthritis and can we prevent or delay disease onset by targeting in the preclinical phase?

**Chapter 2** ................................................................................................................. 20  
IgM-RF, anti-CCP and ACF antibodies decrease during treatment with the tumor necrosis factor blocker infliximab in patients with rheumatoid arthritis  
*Journal of Rheumatology* 2008; 35:425–8

**Chapter 3** ................................................................................................................. 28  
Differential response of the rheumatoid factor and anti-citrullinated protein antibodies during adalimumab treatment in patients with rheumatoid arthritis  

**Chapter 4** ................................................................................................................. 40  
The IgG4 subclass of anti-citrullinated protein antibodies preferentially decreases during treatment with TNF blocking agents in patients with rheumatoid arthritis  
*Annals of the Rheumatic Diseases* 2009; 68: 558-63

**Chapter 5** ................................................................................................................. 52  
Duration of pre-rheumatoid arthritis anti-CCP positivity is positively associated with age at seroconversion  
*Annals of the Rheumatic Diseases* 2008; 67: 1642-3

**Chapter 6** ................................................................................................................. 56  
The role of the shared epitope in arthralgia with anti-cyclic citrullinated peptide antibodies (anti-CCP), and its effect on anti-CCP levels  
*Annals of the Rheumatic Diseases* 2008; 67:1347-50

**Chapter 7** ................................................................................................................. 66  
Arthritis development in arthralgia patients is strongly associated with ACPA status: a prospective cohort study  
*Submitted for publication*

**Chapter 8** ................................................................................................................. 78  
Gene expression profiling in arthralgia patients predicts development of arthritis independent of autoantibody status  
*Submitted for publication*

**Chapter 9** ............................................................................................................... 104  
Dexamethasone in the primary prevention of rheumatoid arthritis: a randomized trial  
*Submitted for publication*

**Chapter 10** ............................................................................................................. 118  
Summary and Discussion

**Chapter 11** ............................................................................................................. 126
