1 General introduction 9

2 Simple wound exudate collection method identifies bioactive cytokines and chemokines in (arterio) venous ulcers Wound Repair and Regeneration; In Press 37

3 Chemokine profiles differ between intracutaneous and subcutaneous locations in early wound healing after breast reduction 57

4 Comparison of cytokine, chemokine and growth factor profiles in burn wounds, chronic wounds and surgical excision wounds 71

5 Skin substitute optimized for healing chronic wounds causes hypergranulation in excision wounds; differential roles for wound bed-derived IL-1α and TNF- α 87

7 Autocrine regulation of re-epithelialization after wounding by chemokine receptors CCR1, CCR10, CXCR1, CXCR2 and CXCR3 J Invest Dermatol, 2011;132:215-225 135

8 Keratinocyte, monocyte and endothelial cell-derived CCL27 promotes cell migration, proliferation and chemokine release in wound healing Submitted for publication 155

9 Structure-activity of histatin, a potent wound healing peptide from human saliva: cyclization of histatin potentiates molar activity 1,000 fold FASEB, 2009;23:3928-3935 175

10 Summary with options for chemokine therapies of burn and chronic wounds 193
