# TABLE OF CONTENTS

## GENERAL INTRODUCTION

Aims and outlines

Chapter 1 Review: Genetic variation of innate immune response genes in invasive pneumococcal and meningococcal diseases applied to the pathogenesis of meningitis

## GENETIC VARIATION AND SUSCEPTIBILITY TO BACTERIAL MENINGITIS

Chapter 2 Single nucleotide polymorphisms in toll-like receptor 9 genes are highly associated with susceptibility to bacterial meningitis in children

Chapter 3 Single nucleotide polymorphisms in pathogen recognition receptor genes are associated with susceptibility to meningococcal meningitis in a pediatric cohort

## GENETIC VARIATION AND SEVERITY OF BACTERIAL MENINGITIS

Chapter 4 Toll-like-receptor 9 polymorphisms are associated with severity variables in a cohort of meningococcal meningitis survivors

Chapter 5 Polymorphisms in Toll-like Receptors 2, 4, and 9 are Highly Associated with Hearing Loss in Survivors of Bacterial Meningitis

## PREDICTION OF LONG TERM CONSEQUENCES OF MENINGITIS

Chapter 6 Independent validation of existing model enables prediction of hearing loss after childhood bacterial meningitis

Chapter 7 External validation of existing model for prediction of academic and behavioural limitations after bacterial meningitis in childhood

Chapter 8 Addition of host genetic variants in a prediction rule for post-meningitis hearing loss in childhood

## DISCUSSION AND CONCLUSIONS

Chapter 9 Discussion and final conclusions

## SUMMARY/SAMENVATTING

Summary of the thesis

Nederlandse samenvatting
