Contents

Chapter 1  General introduction  9

Chapter 2  Uncommon lineage switch warrants immunophenotyping even in relapsing leukemia  43
Leukemia Research, 2009 July; 33(7):e77-e80

Chapter 3  Interleukin-2 receptor alpha-chain (CD25) expression on leukemic blasts is predictive for outcome and level of residual disease in AML  51
European Journal of Cancer. 2009 Jun;45(9):1692-9

Chapter 4  Minimal residual disease detection defined as the malignant fraction of the total primitive stem cell compartment offers additional prognostic information in acute myeloid leukemia  65
International Journal of Laboratory Hematology, 2012 August; 34(4):432-41

Chapter 5  High prognostic impact of flowcytometric minimal residual disease detection in acute myeloid leukemia: prospective data from the HOVON/SAKK AML 42A study  81
Manuscript submitted

Chapter 6  Multiparameter identification of normal and leukemic stem cells: residual leukemic stem cells are a strong predictor of outcome in acute myeloid leukemia  109
Manuscript submitted

Chapter 7  Summary, conclusions and future perspectives  141
