ACKNOWLEDGEMENTS

At long last this epic chapter of my life has come to an end. It has been filled with trials and tribulations of every sort, and I certainly could not have made it through on my own.

Thank you to my parents for allowing me to be a free soul and roam around the world as I please. Elaine, thank you for keeping me up to date on what goes on at home and for being the one who always understands what it is like to be part of our family. Uncle Bill, thank you for all the international plane tickets to spend the holidays with my family, and Uncle George, thanks for all advice about life in Europe and social connections.

To my supervisors Mark, Guus, and Stéphane, thank you for this unique opportunity and your dedication to making this international collaboration work. As we all know, there have been many complications along the way, but somehow we made it! Even if had I know that when you told me I would be a “pioneer” by taking Twinning Cum Laude PhD that what you really meant was I would be the first guinea pig in the pilot experimental protocol I would have eagerly taken the position nonetheless. Mark, your endless optimism throughout this process has been much needed and appreciated. Thank you for tolerating my constant worrying and critical view of everything and everyone, especially of myself. I am certainly a better scientist after our 3.5 years of regular meetings and discussion. Guus and Stéphane, I am grateful that you have allowed me to prod you for all your scientific expertise and contacts and for all the rapid e-mail replies even into the wee hours.

To Sabine and Ka Wan, although you were not my “official” supervisors I am very appreciate of all the time, energy, and consideration you have invested in me. The knowledge I now have about behavioral analysis and fear conditioning as well as mass spectrometry and proteomics...
are thanks to you! Sabine, an extra thanks for being a second mom and trying to cheer me up all the times I have been down.

Thank you to the members of my thesis committee who took the time to read my thesis, give thoughtful comments, and make the journey to Amsterdam just before Christmas.

Ronald and Michel, although we did not complete research projects together, our discussions of “How Science Works” have been equally instructive and I am thankful that you have taken the time to share your knowledge and experiences with me.

To the proteomics team, I most certainly could not have done this without you! Pim, I feel compelled to put you as the official second author on my entire thesis. No one has spent more hours sitting side by side in the trenches with me as you have, and I know you did a great deal of work for my project on your own time as well. I hope you can rest easy now knowing that after this I will not send you any more mails asking to “try the analysis another way”, but I cannot make any promises about what Mark will do! I am grateful that you patiently explained the same things about R/data analysis/mass spectrometry/statistics over and over again to me with an ample number of sketches. Enjoy all my pens, thief. Remco, Roel, Iryna, and Jochem, thank you for always helping me with my mass spec analyses and keeping an eye of those temperamental machines!

Yvonne and Marion, thank you for sharing all your practical lab knowledge and making sure we have all the supplies for our experiments, as long as people remember to write them on the board! Rolinka and Ruud, thank you for teaching me how to do behavioral experiments, looking after my animals, and showing me how to properly work in the mouse house. Maarten, thank you for all the advice on behavior and statics and help with the MLC1 mice.
Lody, it was wonderful getting to know you during all the downtime while learning to culture astrocytes and I appreciate all the tips and tricks you have shared with me.

Brigitte, the whole lab would fall apart without you. I am so thankful for all the assistance you have given me over the years while trying to sort out the mountains of paperwork associated with my complicated employment situation. Thank you for always jumping through hoops and finding ways to make sure I got my salary and refunds.

To the generation before me, Ning, Pieter, Marlene, and Nutabi thank you for the basic skills you shared with me and helping me to get situated into the lab. Most importantly, thank you for making nice thesis books that I could use for inspiration! Andrea, I have not seen a book yet but I know it is on the way. Thank you for showing me the ropes in my first months being part of team glia and for always being so concerned about the state of my struggles with this PhD. I enjoyed all the times we were roommates, both during congresses and while in Amsterdam!

Thank you to all my former officemates who had to tolerate my constant emotional breakdowns and desire for silence. Jörg, our many late night conversations about life, science, and the lab have been very important to me. You have always been good at making me smile by cracking a joke at someone else’s expense. Anya, thank you for being a part of team “quiet office”. I look forward to having our PhD celebration together! Rameshy, I was so sad to see you go, but you will always have a special place in my heart. Thank you for always being so sweet and caring and dropping everything to take breaks in the hall with me when I needed to vent or collapse into tears. I will also never forget all the delicious Indian meals and the soreness I felt after the first time you taught me to play badminton!
To the four Dutchy girls, Anne-Lieke, Céline, Leanne, and Esther, it has been a true pleasure getting to know you. Thank you for all the moments when you have helped and supported me as friends and colleagues. Anne-Lieke, make the best of your new found brown-nosing techniques! Céline, thanks for allowing me to vent my frustrations to you and for your expert behavioral analyses of what constitutes autism spectrum disorders. Leanne, I appreciate all your help with the fear conditioning and DEC organization. Be careful that you don’t end up like Danai, being so valuable that they never let you leave! Esther, if science fails you I am confident you are in a great location to pursue your talents in supplying videos to the erotic cat fetish market.

To the party gang, Natasha, Danai, Loek, Bart, and Priyanka, you guys have really been rocks for me throughout the past 4 years. I thank you for all the holidays, advice, pot luck dinners, new experiences, and nights I can’t remember. My memories with you are the ones I cherish the most. Natasha, my bestie, thank you for putting up with the years of epic drama, introducing me to delicious Indonesian food and delicious Kim Cesarion, and always being my partner in crime. Danai, thanks for all the “breaks”, delicious dinners, and always checking in on me to make sure I am ok. Loek, thank you for being my superman, whether it is fixing my broken bicycle, carrying heavy objects, or giving me shoulder to cry on when I need it. An extra thanks to Danai and Loek for accepting the paranymph responsibilities and helping me to organize all the party festivities. Bart, it is a little bit disgusting how you can be so happy all the time, but it is a wonderful quality and I am grateful you shared that happiness with me. Priyanka (and Martin) thank you for always bringing the party atmosphere and setting an excellent example of how even married couples can be awesome and exciting.
To all my other colleagues who have helped me along the way or taken the time to chat with me in the coffee room, Mariette, Sygrid, Riejanne, Roeland, Reka, Frank, Desiree, Tatiana, Emiel, Nienke, Francesca, Sonya, Anna, Rob, Sara, thank you for making the VU feel like a home. Thank you to my students Lonneke and Jytte for helping me with experiments and making me feel useful!

To my colleagues outside the MCN- Margherita, thank you for being my safe haven during all the ENC Network meetings. I could not have survived them without you! Mohit, thanks for all the weekend coffee breaks and MLC1 discussions. David, thank you for spending so much time teaching me how to do in-gel digestions.

Although the majority of my research was conducted in Amsterdam, I would be remiss not to acknowledge the help I received from my collaborators. At my “home” institution in Bordeaux, thank you Jean Marc for being my temporary supervisor, introducing me to the SON, and helping me with all my administrative and government paperwork. Thank you Aurélie, Nathalie, and Jérôme for teaching me how to work in the lab. A special thanks to Jérôme for also finding me a place to live and helping me to move to Amsterdam. Philippe, I appreciate your detailed responses to my SON questions and sharing your antibodies with me. Ciaran, thank you for being my English-speaking refuge and for all the nights drunk on Bordeaux wine.

A large part of my successful thesis is owed to my Italian collaborators. Gianni, thank you for this opportunity to collaborate and for accepting the position on my thesis committee. Marco, I have really enjoyed all our e-mail conversations. I think we have both taught each other over these many iterations of sample preparation and analysis, so I am grateful for your participation in this project and patience with the slow nature of mass spectrometry analysis.
I would not have made it to this point had it not been for the friends and mentors who inspired and supported me along the way, so thank you to Dr. Densie Flaherty for initiating my passion for research and neuroscience, to the N-track for making Europe feel safe, and to Dr. Kelly Miller for believing in me and living the life I (still) dream of having.

To all of you, I wish you the absolute best success and happiness, and I promise to try to find the same for myself. And, after six years of living in Europe, I am now almost comfortable giving you all kisses XXX
Thank you to Luna and Tuna for your moral support during the thesis writing process. Although you have been very critical of my work, it was my pleasure to provide you with mountains of papers to play with and an over-heated laptop to sit on.
