Acknowledgements

As with most works of creation this thesis was a combined team effort, and it is my honor to finally be able to dedicate my gratitude to those who were intimately involved with this project. Naturally, I would like to start with my former colleagues and express my first thank you to my doctoral supervisor Dr. Klaus Linkenkaer-Hansen. Few have sacrificed so much of their precious time on this project, fueling its progress in equal measures with both constructive critique and hearty humor—in addition to the occasional, but nevertheless marvelous, bits of Danish cuisine. Although at times struggling with some of his “self-organizing” schedules and liberal definition of time-management, many of life’s important lessons are learned the hard way. The true value of these lessons, perseverance, adaptability, independent thought and, most importantly, mastery of the almighty Adobe Illustrator, only revealed itself after a change of scenery. Thank you for your continuous guidance, without which I surely would not be the person I am today.

Pivotal to the success of this project was the extensive and fruitful collaboration with colleagues from the Sleep and Cognition group led by Prof. Dr. Eus van Someren. Without your unwavering support, counsel and the access you provided to the Netherlands Sleep Registry survey platform, there would not have been an ARSQ. My profound gratitude extends further to his team, especially Diederick Stoffers, Jeroen Benjamins, Sarah Moens and Jennifer Ramautar, who each in their own way were critical to this project’s success. Thank you all for sticking with us!

The methodological foundation of this thesis could not have been laid down were it not for the vast expertise of Dr. Sophie van der Sluis, who introduced me to the more advanced (or obscure, it is yet to be decided) aspects of statistical modelling and frequently provided me with kind and desperately needed constructive pointers. Thank you for initiating me to the wonderful field of applied mathemagicks!

Of my direct CNCR colleagues I would like to first and foremost thank Richard Hardstone. Seldom have brilliance of mind and conservation of energy been united in such perfect harmony. From cooking up ingenious algorithms for data analysis and expanding the technical jargon with nifty abbreviations (only with the occasional “lack of thought”) to effectively delegating most of the development work to an endless stream of dron--,
students willing to learn from you. How could they be blamed? Thank you sincerely for helping me out whenever needed and all the best for your future endeavors.

Next I would like to thank my former internship student Rick Wassing, whose ceaseless effort and optimism have contributed significantly to the amount and quality of our data and will surely pave the way for a great future in science. That leaves me to thanking all the other members of the NOC group that contributed to this thesis and the good times I had while working on it, especially Simon-Shlomo Poil who supported the ARSQ since its inception, Mona Irrmischer, Jan Bim, Piotr Sokol, Kim Meijer and Vivian Duijndam.

I would also like to thank my (sadly) former team manager, Douwe Reitsma, who kindly took me under his wing and provided that little extra push towards the finish line of this project. The gratitude extends, naturally, to your successor Boudewijn van Zanten, who continues to lead the team in your spirit. Thank you for your trust and welcoming me into a truly marvelous team of wonderful people. Speaking of the devils: I can finally put an end to the running joke of still not having finished my PhD, in no small part due to all your encouragement. So a big thank you to Tom “Kuifje” Nichting, Bernard “pegleg” de Vries, Peter “the moonlanding was a fluke” Scholte, Bert “want-some-coffee” Hoek, Kees “screw them all” Kuijstermans, Jules “just one more question” Beneken, Siemen “whatever” Terpstra, Jan “one of these days….” Nijhuis and Jan “if you can’t beat them, join them” Flikkema – you guys are the best!

Last but certainly not least, I would like to pay tribute to the head honcho and INF leader professor Huibert Mansvelder and his department. After attending a (barely) significant proportion of early morning lab meetings, I have learned from the frequent acknowledgement slides—usually appearing around the time my mind came wandering home—that there is only one succinct manner of summarizing my gratitude: without you it just wouldn’t have been possible! Thank you so much.

I imagine overcoming the hardships, torments, frustrations and set-backs of any graduate project cannot be sanely accomplished without the safety net that only family and friends can provide. Now is the time to thank them for their ceaseless cheering-up, encouragement and patience. Thank you mother, for always believing in me—I finally made it! To my dear friends Giusi, Mehran and Oscar, who have lend me their ear and knowledge on innumerable occasions, I am grateful beyond measure. To all members of my family who have shown me so much fun and happiness over the years—thank you (in alphabetical order) Arman, Borna, Denna, Jort, Kam, Khodadad, Lilli, Marian, Marije, Myrthe, Rana, Rolf, Ronald, Roya, Shahla and Sherry all so much. No words could possibly convey my gratitude, nor capture the extent of my indebtedness I feel towards my beloved partner Rahil in any meaningful fashion. Now that we have both passed this important way station, a brighter future awaits—I for one plan to celebrate every instant of it with you.
