## Table of Contents

Chapter 1. General Introduction

Chapter 2. Visualization at ultra-high field strength
   2.1 Increased cortical grey matter lesion detection in multiple sclerosis with 7 Tesla MRI: a post-mortem verification study.
   2.2 Ultra-high field MRI visualization of cortical multiple sclerosis lesions with T2 and T2*: a post-mortem MRI and histopathology study.

Chapter 3. Characterization at standard field strength
   3.1 Can multiple sclerosis lesion stages be distinguished with MRI? A post mortem MRI and histopathology study.
   3.2 Multi-scale MRI spectrum detects differences in myelin integrity between multiple sclerosis lesion types.

Chapter 4. Characterization at ultra-high field strength
   4.1 Ultra-high field MTR and qR2* differentiates subpial cortical lesions from normal appearing gray matter in multiple sclerosis.
   4.2 The substrate of increased cortical FA in multiple sclerosis: a 7T post mortem MRI and histopathology study.

Chapter 5. Genetic characterization: associations between histology and genetics
   5.1 HLA-DRB1*1501 has a limited influence on cortical demyelination and inflammation in multiple sclerosis.

Chapter 6. In vivo characterization: MRI-cognition correlates
   6.2 High-resolution T1-relaxation time mapping displays subtle, clinically relevant, gray matter damage in long-standing multiple sclerosis.

Chapter 7. Summary, General Discussion and Future perspectives

Chapter 8. Nederlandse samenvatting
