# TABLE OF CONTENTS

1. Introduction and general outline of the thesis 13

2. The influence of microvascular injury on native T1 and T2* relaxation values after acute myocardial infarction: implications for non-contrast-enhanced infarct assessment 25

3. Magnetic resonance imaging-defined areas of microvascular obstruction after acute myocardial infarction represent microvascular destruction and haemorrhage 41

4. Myocardial infarct heterogeneity assessment by Late Gadolinium Enhancement Cardiovascular Magnetic Resonance imaging shows predictive value for ventricular arrhythmia development after acute myocardial infarction 61

5. Changes in regional myocardial perfusion measured by magnetic resonance imaging after percutaneous coronary intervention for acute myocardial infarction: a substudy of the HEBE cell therapy trial 81

6. Long term outcome after mononuclear bone marrow or peripheral blood cells infusion after myocardial infarction 103

7. A proinflammatory monocyte response is associated with myocardial injury and impaired functional outcome in patients with ST-segment elevation myocardial infarction: monocytes and myocardial infarction 119

8. Intracoronary infusion of mononuclear cells after PC-treated myocardial infarction and arrhythmogenesis: is it safe? 139

9. General considerations and future perspectives 153

**EN** Summary 163

**NL** Samenvatting 167
