I dedicated this thesis to my wife Chao Luo
Acknowledgments

This dissertation is the result of a double doctorate research program, which has taken me on a journey, travelling between different continents. It has been a time of incredible intellectual growth, fostered by a mix of wonderful learning environments at the Nanjing Normal University in Nanjing and the Vrije Universiteit in Amsterdam. Writing this dissertation would not have been possible without the support of my family, friends, colleagues, and supervisors. Therefore, I would like to express my deepest appreciation to all those who provided me the possibility to complete this thesis.

First, I would like to express my sincere gratitude to my promoters and supervisors, prof. dr. Ronald van Balen and prof. dr. Hongbo Zheng, whose expertise and understanding added considerably in the creation of this dissertation. They provided me the opportunity to do my PhD research, but above all I appreciate how they kept me on the right track during my PhD.

I am eternally obliged dr. M.A. Prins, dr. C.J. Beets and dr. S.R. Troelstra for their scientific support, contagious enthusiasm and general help along the process of research and writing this dissertation. Without them this dissertation could not be written to its fullest.

In the context of opportunities I also have to show my appreciation to prof. dr. X.Q. Li and prof. dr. J. Zhou, who helped designing the project.

I would like to thank the members of the reading committee in the Netherlands, dr. M.E. Donselaar, prof. dr. F. Lehmkuhl, prof. dr. L.J. Lourens, prof. dr. J. Vandenberghe and prof. dr. G-J. Weltje for taking time to read my thesis and provide me with helpful suggestions. For similar reasons I must also show recognition to the members of my Chinese reading committee, prof. dr. X.M. Hu, prof. dr. X.Q. Li, prof. dr. D. M. Taylor, prof. dr. S.M. Wang, prof. dr. H. Yang and prof. dr. S.Y. Yang.

My research involved the analyses of a deep terrestrial core, drilled in Central China. It goes without saying that it would be impossible for me to conduct my research without the tremendous effort of a group of workers in the field who retrieved the core. The guidance of dr. B. Wang and Y.L. Chen during the extensive drilling period is much appreciated.

I have also benefited greatly from discussions on various topics with dr. H. Zhong, dr. Y. Zheng, dr. Q. Yang, dr. C. Kasse and dr. S.J.P. Bohnke, who tragically passed away before I could finish this thesis. Thanks also goes out to my colleague researchers and fellow students: dr. P. Wang, dr. Z.J. Hu, dr. M.Y. He, X.C. Wei, X.Y. Yao, Z.H. Wang, M.J. Yang, Y.S. Zhou, Y.Y. Wang G.J. Ling, who not only helped me during research and lab work, but also provided me with welcome distractions from academic work.

I would also like to thank my family: my parents, my grandparents, my sister and brother for the support and encouragement they provided me throughout my entire life. They always stood behind me and I could not express in words how grateful I am for that.

From the moment I first came to Nanjing, there was only one person, who was always there for me. She became my best friend and I am truly delighted that I can call her my wife. Although she is from China, I would like to call her by English name. Niki, I thank you for your care and patience during the long writing process of this thesis. I doubt that I can ever convey my full appreciation of what you mean to me, but I owe you my eternal gratitude. It seems only right that I dedicate this thesis to you.
