

Table of Contents

1	Introduction to vesicle mechanics at the nanoscale	1
1.1	On the role of mechanical stimuli in cell biology	2
1.1.1	Influence of particles stiffness for cellular uptake	2
1.2	Vesicles in biology	3
1.2.1	Structure and functions of vesicles in cell biology	3
1.2.2	Extracellular vesicles	4
1.2.3	Liposomes	5
1.2.4	Role of mechanics of vesicles	5
1.3	Elasticity theory	7
1.3.1	Properties of isotropic materials	7
1.3.2	Thin plate and thin shell theory	8
1.3.3	Hertz theory	9
1.3.4	Canham-Helfrich theory for membrane mechanics.	9
1.4	Atomic Force Microscopy (AFM)	11
1.4.1	Basic principle of (bio-)AFM	11
1.4.2	Imaging modes in AFM	12
1.4.3	Imaging and tip dilation effect.	12
1.4.4	Nano-indentation	13
1.4.5	Noise isolation	13
1.5	Outline thesis.	14
2	Single vesicle imaging and force spectroscopy by atomic force microscopy	19
2.1	Abstract	20
2.2	Introduction	21
2.3	Experimental design	22
2.3.1	Vesicle adhesion to the surface.	22

2.3.2	Force distance curve based imaging of vesicles.	22
2.3.3	Nano-indentation of vesicles.	24
2.3.4	Image analysis for accurate size and shape measurement. . .	25
2.3.5	Analysis of FDC curves.	27
2.3.6	Cantilever and tip selection.	28
2.4	Applications and limitations of the method	29
2.5	Anticipated results	30
2.6	Conclusion	30
3	Bending and internal pressure determine the nanomechanics of liposomes	35
3.1	Abstract	36
3.2	Introduction	37
3.3	Results	39
3.3.1	Size and shape determination of adherent vesicles.	39
3.3.2	Nano-indentation of liposomes.	40
3.3.3	Influence of AFM tip size on mechanical response.	41
3.3.4	Modeling the response of vesicles to nanoindentations. . . .	42
3.4	Discussion	46
3.5	Materials & Methods	48
3.6	Appendix I: The quantitative model	53
3.6.1	The model.	53
3.6.2	Symmetric, Parabolic tips.	54
3.6.3	Parabolic tip and flat surface.	54
3.7	Appendix II: Supplementary figures	55
4	Detection and mechanical characterization of small multilamellar vesicles by atomic force microscopy	61
4.1	Abstract	62
4.2	Introduction	63
4.3	Results	65
4.3.1	MLV imaging and nanoindentations.	65
4.3.2	Lipid bilayer imaging and nanoindentations.	66

4.3.3	Determination of the degree of lamellarity.	67
4.3.4	Mechanical characterization of MLVs.	67
4.4	Discussion	71
4.5	Materials and methods.	72
4.6	Appendix: Supplementary Figures	76
5	Mechanics of extracellular vesicles excreted by red blood cells are dominated by the fluidic membrane and are softened in Spherocytosis	79
5.1	Abstract80
5.2	Introduction81
5.3	Results82
5.3.1	Geometric characterization of RBC EVs.	82
5.3.2	Nanoindentation and collapse of RBC EVs.	84
5.3.3	Protein and lipid content of RBC EVs.	86
5.3.4	Bending modulus estimation of RBC EVs.	87
5.3.5	Characterization of EVs derived from spherocytosis patients.	88
5.4	Discussion91
5.5	Materials & Methods.93
5.6	Appendix: Supplementary Figures	100
6	Controlled tip wear on high roughness surfaces yields gradual broadening and rounding of cantilever tips	105
6.1	Abstract	106
6.2	Introduction	107
6.3	Results	109
6.3.1	Tip wear on high roughness surfaces.	109
6.3.2	Quantification of tip wear.	111
6.3.3	Fast <i>in situ</i> tip wear tracking.	112
6.4	Discussion	114
6.5	Materials & Methods.	115
6.6	Appendix: Supplementary Figures	119

7	The role of the cytoskeleton in sensing changes in gravity by non-specialized cells: a literature review	123
7.1	Abstract	124
7.2	Introduction	125
7.3	The cytoskeleton: an attractive target for gravity perception	127
7.4	Experimental observations of cytoskeletal changes during microgravity	128
7.5	Experimental observations of cytoskeletal changes during simulated microgravity.	132
7.6	Organelle weight change as an initial mechanism that could influence the cytoskeleton	136
7.7	Other mechanisms by which gravity magnitude could influence the cytoskeleton.	139
7.8	Hypergravity studies complement microgravity studies to characterize sensing mechanisms	140
7.9	Gravity-perception in plants: a better-characterized system.	141
7.10	Concluding remarks	142
8	General discussion and outlook	151
8.1	General discussion	152
8.1.1	Comparison with other bending moduli measurements.	152
8.1.2	Implications for interaction with the target cell	153
8.2	Pushing further: Outlook	154
8.2.1	Towards bending modulus measurement of individual vesicles.	154
8.2.2	Complementary measurement of the stretch modulus	157
8.2.3	Application to and expectations for other vesicles of interest.	158
8.2.4	Tuning the rigidity of vesicles for optimization of cellular uptake	160
	Appendices	163
	Nederlandse Samenvatting	165
	Acknowledgements/Dankwoord	169
	Publication List.	173
