CONTENTS

Chapter 1  General Introduction

Chapter 2  Heterodimeric bone morphogenetic protein-27 is not superior to homodimeric BMPs in restoring osteoblastogenesis inhibited by all-trans retinoic-acid

Chapter 3  All-trans retinoic-acid inhibits heterodimeric bone morphogenetic protein 2/7-stimulated osteoclastogenesis and osteoclasts activity

Chapter 4  Notoginsenoside R1 can significantly promote in-vitro osteoblastogenesis

Chapter 5  A novel bone-defect-filling material with sequentially orchestrated potent bactericidal property and osteoinductive activity

Chapter 6  Biomaterials with antibacterial and osteoinductive properties to repair infected bone defects

Chapter 7  pH dependent silver nanoparticles releasing titanium implant: A novel therapeutic approach to control peri-implant infection

Chapter 8  General Discussion

Chapter 9  General Summary

Appendices  Acknowledgements

Curriculum Vitae
