# Table of contents

## Chapter 1

Introduction and scope........................................................................................................... 7

## Chapter 2

Methodologies for effect-directed analysis: environmental applications, food analysis and drug discovery......................................................................................................................... 15

2.1 Introduction..................................................................................................................... 16

2.2 The principle of traditional Effect-Directed Analysis..................................................... 18

2.3 Sample preparation........................................................................................................ 19

2.4 Fractionation for bioassay testing.................................................................................. 33

2.5 Miscellaneous approaches............................................................................................ 40

2.6 Bioassay testing............................................................................................................. 45

2.7 The identification and confirmation process................................................................... 50

2.8 Latest scientific advancements...................................................................................... 57

2.9 Conclusion and perspectives........................................................................................ 62

## Chapter 3

Rapid activity-directed screening of estrogens by parallel coupling of liquid chromatography with a functional gene reporter assay and mass spectrometry......................................................................................................................... 81

Abstract............................................................................................................................... 82

3.1 Introduction..................................................................................................................... 83

3.2 Materials and methods.................................................................................................. 86

3.3 Results and discussion................................................................................................. 91

3.4 Conclusions................................................................................................................... 99
Chapter 4

Highly selective screening of estrogenic compounds in consumer electronics plastics by liquid chromatography in parallel combined with nanofractionation-bioactivity detection and mass spectrometry

Abstract

4.1 Introduction

4.2 Materials and methods

4.3 Results and Discussion

Acknowledgments

Supplementary Information

References

Chapter 5

High-resolution contact-free fraction collection for liquid chromatography using a solenoid valve

Abstract

5.1 Introduction

5.2 Materials and Methods

5.3 Results and Discussion

5.4 Conclusions

Acknowledgements

Supplementary information

References
Chapter 6
Gas chromatography fractionation platform featuring parallel flame-ionization detection and continuous high-resolution analyte collection in 384-well plates

Abstract
6.1 Introduction
6.2 Materials and methods
6.3 Results and discussion
6.4 Conclusions
Acknowledgments
References

Chapter 7
Continuous fraction collection of gas chromatographic separations with parallel mass spectrometric detection applied to cell-based bioactivity analysis

Abstract
7.1 Introduction
7.2 Materials and methods
7.3 Results and discussion
7.4 Conclusion
Acknowledgements
References
