To be able to know which development projects work, rigorous research is needed, even in the case of carefully collected data. This thesis illustrates the importance of organizing research and data collection carefully in the case of health care interventions in three sub-Saharan African countries, all with a particular emphasis on data collection and its consequence on estimation of the effects of interest.

Zlata Tanovic holds undergraduate degrees in mathematics and physics from Leiden University, and a master's degree in econometrics from the University of Amsterdam. As a PhD Candidate in Economics at Vrije Universiteit Amsterdam, and a researcher at the Amsterdam Institute for International Development (AIID), she conducted health economics research in developing countries. This dissertation draws on her research at AIID. As a PODER fellow at Universitat Pompeu Fabra, Barcelona, she continued with health and development economics research. Currently she is based in Barcelona and working as a data scientist at Knowledge Discovery & Predictions (KDP).
