

## Table of contents

|                   |  |     |
|-------------------|--|-----|
| <b>Chapter 1</b>  | General introduction   | 9   |
| <b>Chapter 2</b>  | Does implicit motor learning lead to greater automatization of motor skills compared to explicit motor learning?<br>A systematic review  | 21  |
| <b>Chapter 3</b>  | Is implicit motor learning preserved after stroke? A systematic review with meta-analysis  | 87  |
| <b>Chapter 4</b>  | The inclination for conscious motor control after stroke: Validating the Movement-Specific Reinvestment Scale for use in inpatient stroke patients                                     | 139 |
| <b>Chapter 5</b>  | Over-focused? The relation between patients' inclination for conscious control and single- and dual-task motor performance after stroke  | 159 |
| <b>Chapter 6</b>  | How physical therapists instruct patients with stroke: An observational study on attentional focus during gait rehabilitation after stroke   | 183 |
| <b>Chapter 7</b>  | External attentional focus enhances movement automatization: A comprehensive test of the Constrained Action Hypothesis   | 203 |
| <b>Chapter 8</b>  | Stay focused! The effects of internal and external focus of attention on movement automaticity in patients with stroke   | 221 |
| <b>Chapter 9</b>  | Are the effects of internal focus instructions different from external focus instructions given during balance training in stroke patients? A double-blind randomised controlled trial | 243 |
| <b>Chapter 10</b> | Epilogue<br>Nederlandse samenvatting<br>Dankwoord<br>About the author  | 265 |
