CONTENTS

Chapter 1 General introduction 11

Part I: The role of complement in the acute phase response after burns

Chapter 2 Review: The role of complement in the acute phase response after burns 23

Chapter 3 The local and systemic inflammatory response in a pig burn wound model with a pivotal role for complement 41

Chapter 4a CRP levels in the blood correlate positively with burn wound size early after burn wound induction in adult patients 63

4b Endogenous C1-esterase inhibitor levels are increased in the blood after burn injury on the long term independent of burn size but do only partly coincide with increased C1-esterase inhibitor activity levels 73

Chapter 5 C1-esterase inhibitor administration reduces local inflammation and capillary leakage, without affecting long-term wound healing parameters, in a pig burn wound model 85

Part II: The role of coagulation and oxidative stress in the pathophysiology of burns

Chapter 6 Neutrophil extracellular traps coincide with a pro-coagulant status of microcirculatory endothelium in burn wounds 109

Chapter 7 Homocysteine-induced inverse expression of Tissue factor and DPP4 in endothelial cells is related to NADPH oxidase activity 127

Chapter 8 A new method to determine wound age in early vital skin injuries: a probability scoring system using expression levels of Fibronectin, CD62p and Factor VIII in wound haemorrhage 141

Chapter 9 NOX2 expression is increased in keratinocytes after burn injury 157

Chapter 10 General discussion 175

Chapter 11 Nederlandse samenvatting (Summary in Dutch) 189
